

Hybrid Identity

Define user identities

Define application identities

Architecture overview

The need to keep application components on-premises doesn't have to be a barrier to adopting cloud technologies. With Azure Stack, app components can reside on-premises while interacting with components running in Azure public cloud. This blueprint enables teams to manage identity for users as well as applications in a way that is consistent across clouds.

Define User Identities

- 1 Set up an Azure Active Directory tenant.
- 2 Create users.
- 3 Deploy, manage, and operate application resources on Azure and Azure Stack.

Define Application Identities

- 4 Create service principles.
- 5 Deploy with service principles.
- 6 Application resources can communicate over network.
